

Task-5 Implement various searching and sorting operations in Python programming

Aim :- To implement various searching and sorting operations in Python programming

5.1 A company stores employee records in a list of dictionaries where each dictionary contains id, name and department. Write a function `find_employee_by_id` that takes this list and a target employee ID as arguments and returns the dictionary of the employee with the matching ID, or None if no such employee is found.

Algorithm:-

- 1) input definition.
 - a. Define the function `find_employee_by_id` that takes two parameters:
 - a. A list of dictionaries (`employees`) where each dictionary represents an employee record with keys `id`, `name`, and `department`
 - b. An integer (`target_id`) representing the employee ID, to be searched
 - b. iterate through the list
 - * use a for loop to iterate through each dictionary in the employee list
 - c. check for matching ID
Within the loop check if the `id` found of the current dictionary matches the `target_id`.
 - d. Return matching Record
If a match is found return the current dictionary

OUTPUT

```
===== RESTART: C:/Users/91979/Desktop/  
/Print1/t3.py  
{'id': 2, 'name': 'Bob', 'department': 'Engineering'}
```

6. Handle no. match
if the loop completes without finding a match
return none

Program :-

```
def find_employee_by_id(employee, target_id):  
    for employee in employees:  
        if employee['id'] == target_id:  
            return employee  
    return None  
  
# Test the function  
employees = [  
    {'id': 1, 'name': 'Alice', 'department': 'HR'},  
    {'id': 2, 'name': 'Bob', 'department': 'Engineering'},  
    {'id': 3, 'name': 'Charlie', 'department': 'Sales'},  
]  
  
print(find_employee_by_id(employees, 2))  
  
# Output: {'id': 2, 'name': 'Bob', 'department': 'Engineering'}
```

5.2 You are developing a grade management system for a school. The system maintains a list of student records. This list is represented as a dictionary containing a student's name and score. The school needs to generate a report that displays students' scores in ascending order. Your task is to implement a feature that sorts the student records by their scores using the bubble sort algorithm.

Algorithm :-

1) Initialization:-

- Get the length of the students list and store it in n .

2) Outer loop:

- Iterate from $i=0$ to $n-1$ (inclusive). This loop represents the number of passes through the list.

3) Track swaps

- Initialize a boolean variable `swapped` to `false`. This variable will track if any swaps are made in the current pass.

4) Inner loop

• Iterate from $j=0$ to $n-i-2$ (inclusive). This loop compares adjacent elements in the list and performs swaps if necessary.

5) Compare and Swap:

- For each pair of adjacent elements (i th student $s[i]$ and $(i+1)$ th student $s[i+1]$)

- Compare their score value

- If $s[i][\text{'score'}] > s[i+1][\text{'score'}]$

Swap the two element

- Set swapped to true to indicate that a swap was made
- Early Termination

- After each pass of the inner loop check if swapped is false if no swaps were made during the pass the list is already sorted and you can break out of the outer loop early

2) Completion :-

- The function modifies the students list in place, sorting it by score.

Program :-

```
def bubble-sort-scores(students):
    n = len(students)
    for i in range(n):
        # Track if any swap is made in this pass
        swapped = False
        for j in range(0, n-i-1):
            if students[j][score] > students[j+1][score]:
                # Swap if the score of the current student
                # is greater than the next student
                students[j], students[j+1] = students[j+1], students[j]
                swapped = True
        # If no two elements were swapped the list
        # is already sorted
        if not swapped:
            break
    # Example usage
```

OUTPUT:-

Before Sorting

{'name': 'Alice', 'Score': 88}

{'name': 'Bob', 'Score': 95}

{'name': 'Charlie', 'Score': 75}

{'name': 'Diana', 'Score': 85}

{'name': 'Eve', 'Score': 90}

After Sorting

{'name': 'Charlie', 'Score': 75}

{'name': 'Diana', 'Score': 85}

{'name': 'Alice', 'Score': 88}

{'name': 'Bob', 'Score': 95}

Students = {

{'name': 'Alice', 'score': 88},
{'name': 'Bob', 'score': 95},

{'name': 'Charlie', 'score': 75},
{'name': 'Diana', 'score': 85},

}

Print ("Before sorting:")

for student in students:

Print (student)

bubble - sort - scores (students)

Print ("After sorting:")

for student in students:

Print (student)

VELTECH	
EX No.	5
PERFORMANCE (5)	5
RESULT AND ANALYSIS (5)	5
VIVA VOCE (5)	5
RECORD (5)	5
TOTAL (20)	15
SIGN WITH DATE	03/07/2017

Result :- Thus the program for various searching and sorting operations is executed and verified successfully.
